Crop Disease Detection Report

Generated on March 26, 2026 | 08:55 AM

Disease Detected	Tomato - Late Blight
Confidence Score	85.1%
Confidence Level	High
Analysis Status	Complete

Analyzed Leaf Image

Symptoms

Large brown water-soaked blotches on leaves, white fuzzy mold on undersides, rapid plant death (within days), affects stems and fruits, foul odor from infected tissue

Causes

Caused by Phytophthora infestans (same as potato blight), spreads rapidly in cool wet weather (60-70°F), high humidity, wind-borne spores, infected tubers

Treatment Methods

Remove and destroy infected plants immediately, apply fungicides with chlorothalonil or mancozeb, do not compost infected material, act quickly as disease spreads fast

Preventive Measures

Plant resistant varieties, ensure good drainage, avoid overhead irrigation, space plants properly, monitor weather conditions, remove volunteer plants

Recommended Pesticides

Chlorothalonil (Bravo), Mancozeb + Copper, Metalaxyl (Ridomil), Cymoxanil (Curzate), Apply preventively before symptoms appear

Organic Solutions

Copper fungicide (apply early), Destroy infected plants, Improve air circulation, Avoid working with wet plants, Use disease-free transplants
